

MACHINE CAPACITIES (.75L / 750ml)

CAPACITY	Rinser-Filler-Closure
2000bph	12-12-1
3000bph	16-16-4
6000bph	30-30-6
10.000bph	48-48-8
10.000bph - 25.000bph	INQUIRE

Custom layout designs available to fit your production needs. DIPRAN can supply monoblocks, multiblocks and complete lines from depallitiser to final packaging

New Approach For Beverage Filling

TARVISIA

TARVISIA is a revolutionary filling system developed and patented by DIPRAN S.r.l located in Modena, Italy home of Lambrusco production. The TARVISIA filling system can be used in a wide range of facilities for packaging still or non-carbonated wine, premium spirits, vinegar, oils, olive oil and creams.

The main defining difference between the TARVISIA filling system and other competitor filling systems is the ability to fill these products without the use of dynamic moving internal parts in the fill valve. This allows for faster more efficient washing, gentle liquid filling, loss no great than 0.05% alcohol and less than 200ppb O2 pickup, which can be further reduced with inert gas injection.

Used in some of the most regarded wine, spirit & vinegar facilities in the world TARVISIA has filled millions of bottles of some of the most highly sort after products. With filler solutions for virtually every application involving still liquids or cream TARVISIA is your filling solution.

TIFEFENBRUNNER, Italy	MonoBlock Tarvisia 16-16-4

This revolutionary filling system provides the filling facility multiple benefits which reduces downtime, labour cost, cost due to product lose and maintenance cost with the biggest benefit coming from maintaining the integrity of high value, premium products.

The TARVISIA system allows the operator to perform change overs between products in approximately 20 minutes including washing between different colour products due to the unique washing ability of the valve.

With no dynamic movement and zero internal gaskets maintenance is virtually non-existent on the fill valve

With the addition of the recovery system TARVISIA can reduce the lose of high value product from the self-levelling function. Another added benefit is the reduction of aroma lose during the filling process due to product running along the bottle walls with zero turbulence.

With the optional VARI-STAR system DIPRAN is able to provide a universal solution for different size formats and quick change over between bottle sizes without the need for separate star wheels.

The operator can change formats in minutes with this system reducing change over time in some cases reducing downtime up to 60% and can be used for bottles with diameters from 50mm to 100mm.

Other added benefits are the reduction of cost for change over parts, reduction of storage for additional formats and finally the ability to work with new formats / desgins without having to buy or test new equipment.
